Qscreen™ is the new iPad® application from Quest Diagnostics that improves event quality, streamlines results capture, reduces the paperwork associated with fingerstick events, and enables real-time upload of results to the participant record to reduce the data latency associated with processing time.

**Greater scheduling flexibility**
Service levels at fingerstick events are improved with Qscreen because less time is spent locating participant data during a screening encounter. Qscreen eliminates the need to ship and locate paper requisitions for scheduled and walk-in participants. By pairing Qscreen with our commitment number offering, we can allow scheduling to continue closer to the day of the event.

**How it works**
Qscreen is an iPad application that offers efficiencies by eliminating the paperwork processes completed before, during, and after fingerstick biometric wellness screening events.
- The application is integrated into the Wellness Engine
- Scheduled appointments are downloaded the night before the event
- Optics checks and quality assurance (QA) are completed on the iPad before any participants can be screened
- Data entry of biometrics and labs includes a participant review and verification process
- Data uploaded to the Wellness Engine
- In most cases, online reporting will be available within hours of the event and sent to authorized third parties within 24 hours
Event technology enhancing the fingerstick experience

**Efficient and enhanced participant experience**
With Qscreen, scheduled appointments are readily available on the device, and unscheduled participants can be easily located and scheduled in real time as walk-in participants whether the device is in a connected or disconnected state. The application also streamlines the process of attaining participant satisfaction scores through the integration of a short satisfaction survey immediately following the screening.

**Superior data quality**
With Qscreen, all QA requirements to release results are confirmed before a single participant is screened, immediately improving the quality of your fingerstick event data. By embedding QA into onsite event preparation, the risk of non-reportable results is also eliminated.

**Significantly reduced data processing time**
In most cases, Qscreen reduces the data processing time to one day. Data is provided more quickly to employers’ authorized third-party partners, which may include health plans and incentive management and coaching partners, so that they can take action more quickly. For employers who have enabled online participant reporting, participants can often view their results within hours of their event.

**Customized for your program**
Employers who required a custom consent process or would like to include attestation questions in the application can require participants to complete consent and answer customized question sets within the application as part of the screening process.
